Chapter 4 -- Decimals

$34.99 \Rightarrow \text{decimal notation}

ex. The cost of an object. ex. The balance of your bank account ex. The amount owed
ex. The tax on a purchase.

Just like Whole Numbers –
Place Value - 1.23456789

from the decimal point: ones, decimal (and), tenths, hundredths, thousandths, ten-thousandths, hundred-thousandths,…see page 235

Write in words 3.456 \Rightarrow ____________________________

ex. Write a check for $38.43 \Rightarrow ____________________________

ex. You buy two items that sell for $85.90 and $42.30. You pay a total of $13.22 in taxes. How much should you write a check for? Write it.

Notice that we can write 8 / 4 = ___ 12 / 3 = ______ 24 / 6 = _______

We can write fractions as decimals
Sometimes they terminate some times they do not (nonterminating)

ex. 7 / 10 = ___ 3 / 8 = _______ but 2 / 3 = __________

Other fractions:

7 / 25 = __________ ex. 42 / 1000 = __________ 7 / 9 = __________

What place value is the digit 3 in the number 42.567321? \Rightarrow __________
Write as a decimal.

\[ \frac{3}{10} = \underline{0.3} \] , \[ \frac{93}{100} = \underline{0.93} \] \[ \frac{58}{1000} = \underline{0.058} \]

Write as a fraction.

\[ 0.4 = \underline{\frac{2}{5}} \] , \[ 0.24 = \underline{\frac{6}{25}} \] \[ 0.004 = \underline{\frac{1}{250}} \]

Write in words.

\[ 0.023 = \underline{twenty-three} \underline{thousandths} \] \[ 23.05 = \underline{twenty-three} \underline{and} \underline{five} \underline{tenths} \]

**Order.** Insert the correct symbol ( < or > )

\[ 2.3 \quad 2.03 \quad 0.41 \quad 0.401 \quad 0.203 \quad 0.0343 \]

**Rounding:** Round the number to the given place value

\[ 8.345 \text{ tenths } \Rightarrow \underline{8.3} \]
\[ 35.0256 \text{ thousandths } \Rightarrow \underline{35.026} \]

**Addition and Subtraction** of decimals
We still have the same rule of signs

ex. Add: 0.435 + 9.7 + 87.43 \hspace{1cm} ex. Subtract 43.82 - 9.876

evaluate: x - y if \[ x = -7.37 \text{ and } y = -3.921 \]

**Estimate:** 53.29 - 0.89
Multiplication of Decimals:
sum of the decimal places of the factors have to equal the decimal places of the product.

\[ 3.2 \times 8 = \text{__________} \quad 4.2 \times 1.2 = \text{__________} \]

\[-43.2 \times 2.01 = \text{__________} \]

Special Case: When multiplying by powers of 10 such as 10, 100, 1000:

ex. \( 10 \times 3.25 = \text{__________} \quad 456.1 \times 100 = \text{__________} \quad 56.02 \times 10^5 = \text{__________} \)

Division: \( 8 \div 4 = 2 \); 4 is the divisor and 2 is the quotient

Move the decimal point in the divisor to the right so that the divisor is a whole number. Move the decimal place in the dividend the same number of places. Place the decimal point directly above.

ex. \( 256.04 \div 0.4 = \) \quad ex. \( 3.03505 \div 1.01 = \)

Special Case: Division by powers of 10;

\( 48.03 \div 100 = \text{__________} \quad 4.2105 \div 10 = \text{__________} \quad 0.032 \div 1000 = \text{__________} \)

We can write every fraction as a decimal if we interpret the fraction bar as a division. When we write a fraction as a decimal we get two types of decimal expression; terminating and nonterminating

ex. \( \frac{3}{5} = \text{__________} \quad \frac{5}{8} = \text{__________} \quad \frac{3}{11} = \text{__________} \)

ex. \( \frac{9}{1000} = \text{__________} \quad \) ex. \( 2 \frac{5}{9} = \text{__________} \)
We can also reverse the process and write a decimal expression as a fraction.

ex. 0.023 = __________

ex. 4.01 = __________

ex. 0.004 = __________

ex. 0.125 = __________

Estimate by rounding.

ex. 3.02 • 49.1 = __________

ex. 456.1 ÷ 0.34 = __________

ex. 4.02 - 0.097 = __________

Evaluate if \(x = 0.1\) and \(y = -2.1\);

\(-x^2 = __________\)

\(-xy = __________\)

Compare decimal expressions (and fractions):

ex. \(\frac{9}{10}\) 0.89

ex. \(\frac{7}{18}\) 0.39

ex. \(\frac{8}{15}\) 0.543

Other Examples:

ex. Your annual salary last year was $52432. What was your monthly salary? ________

ex. You travel 34.2 miles per gallon. If you have a car with a 12.8 gallon capacity, then what is the maximum number of miles that you can travel?
ex. A year consists of 52 weeks. You get a biweekly salary of $850. What is your yearly pay?

ex. At the end of each of month you save a fixed amount into a savings account. At the end of 1 \( \frac{1}{2} \) years you have $2400. How much did you save each month?
Equations:
As before we have two basic types of operations that can be used to solve equations.

ex. $-4v = 7$ (write as a decimal)  

ex. $-2.02 + 1.5x = -4.12$

ex. $-7.1 - x = 4.01$

$1.02 - x = 0.1 \Rightarrow x = \_\_\_\_\_\_\_

ex. $6.6 - 2.2x = 0.44 \Rightarrow x = \_\_\_\_\_\_\_

$x / -0.4 = 8 \Rightarrow x = \_\_\_\_\_\_

Square roots and perfect squares

Perfect Squares: 1, 4, 9, 16, 25, 36, 49, ....

Def. A square root of a positive number $x$ is a number whose square is $x$.

ex. 4 is square root of ______ since $4^2 = ______$

ex. $-8$ is the square root of ______ since $( -8 )^2 = ______$
Every positive number has two square roots; one positive and one negative. We use the symbol \( \sqrt{\cdot} \) to represent the positive square root.

Notation: \( \sqrt{x} \)

\( \sqrt{\cdot} \) is called the radical, \( x \) is is called the radicand

Each of these numbers has two square roots:
4 and 25 since \( (-2)^2 = 4 \), \( (2)^2 = 4 \); \( (-5)^2 = (5)^2 = 25 \)

The radical only refers to the positive square root. \( \sqrt{49} = 7 \),

if we want the negative value we write \( -\sqrt{49} = -7 \)

More Examples:
Find all of the square roots of

64 \( \Rightarrow \) _______, _______

121 \( \Rightarrow \) _______, __________

400 \( \Rightarrow \) _______, __________

Find

\( \sqrt{81} = \) ______, \( \sqrt{169} = \) ________, \( -\sqrt{144} = \) ______

What is

\( \sqrt{49} - \sqrt{16} = \) ______

\( \sqrt{25} + \sqrt{4} = \) ________

\( 5 \cdot \sqrt{36} = \) ______

\( \sqrt{25} \cdot \sqrt{16} = \) ______

\( \sqrt{\frac{9}{16}} = \) ______
Not all whole numbers are perfect squares – what do we do when we try to find the square root of such a whole number?

\[ \sqrt{26} = \underline{\hspace{2cm}} \quad \sqrt{53} = \underline{\hspace{2cm}} \]

What two consecutive whole numbers does \( \sqrt{37} \) lie between?

\[ \underline{\hspace{2cm}} < \sqrt{37} < \underline{\hspace{2cm}} \]

We can give approximations with a calculator or an algorithm – we also have exact values.

**Property of radicals**

\[ \sqrt{ab} = \sqrt{a} \cdot \sqrt{b} \] We can use this property to simplify radicals -

Find (exact value)

\[ \sqrt{20} = \underline{\hspace{2cm}} \quad \sqrt{50} = \underline{\hspace{2cm}} \]

\[ \sqrt{18} = \underline{\hspace{2cm}} \quad \sqrt{80} = \underline{\hspace{2cm}} \]
Real Numbers

Now that we have introduced radicals, we are ready to complete the set that we call the set of real numbers.

Sets of Numbers

\{ 1, 2, 3, \ldots \} \Rightarrow \underline{\ldots}

\{ 0, 1, 2, 3, \ldots \} \Rightarrow \underline{\ldots}

\{ \ldots -3, -2, -1, 0, 1, 2, 3, \ldots \} \Rightarrow \underline{\ldots}

A rational number is a number that can be written as a fraction \( \frac{a}{b} \), where both \( a \) and \( b \) are integers. Every rational number has a decimal expression that is terminating or repeating.

\[
\frac{1}{5} = 0.2, \quad \frac{3}{8} = 0.375, \quad \frac{5}{9} = 0.5555\ldots = \overline{.5}
\]

\[
0.231456231456\ldots = 0.231456
\]

An irrational number is a number whose decimal representation never terminates or repeats -- cannot be written as a fraction of integers.

\[
\pi = 3.1415926\ldots, \quad \sqrt{2} = \underline{\ldots}, \quad 0.31231122311222\ldots, \quad 0.2010010001\ldots
\]

The set of rational numbers and the irrational numbers when combined create the set of real numbers.

We can plot these numbers on a number line ---

ex. Plot -5, 7, 3.5, \( \sqrt{3} \)

ex. We can also write real numbers on the number line with inequalities –

a) Write down all of the real numbers less than 2

b) Write down all of the real numbers greater than or equal to -1

c) Write down all the numbers between -2 and 3
ex. Which of the values -4, 0, 2, 3/2, make the inequality \( x \geq 2 \) true? _____________

ex. Which of the values 2, 2.1, 0.21 make the inequality \( x > 2.01 \) true? _____________

Properties of Real Numbers:

1. \( a + b = b + a \) ➔ _________________
2. \( ab = ba \) ➔ _________________

3. \( (a + b) + c = a + (b + c) \) ➔ _________________
4. \( a(bc) = a(bc) \) ➔ _________________

5. \( a(b + c) = ab + ac \) ➔ _________________

6. Addition Property of 0 ➔ _________________, we call 0 the additive identity

7. Multiplication Property of 0 ➔ _________________

8. Multiplication Property of 1 ➔ _________________, we call 1 the multiplicative identity

9. Inverse Property of addition ➔ _________________, \( a \) and \( (-a) \) are called additive inverses of each other (we also call them) _________________ of each other

10. Inverse Property of Multiplication ➔ If \( a \neq 0 \), then _________________, \( a \) and \( 1/a \) are called multiplicative inverses of each other.
Find
6( 3x ) = _____________ Why ?
(3x ) • 5 = _____________ Why ?

(2x)(5x) = _____________ Why ?

1 • c = _______ - 1 • c = _______ ( -3 ) • ( -c )= _____________

-3t + 8 + 3t = _____________
2( 3x + 4) = _____________

- 2 ( 3x + 5 ) = _____________ - 4( 2x + 4 )= _____________

- 4 ( 3x - 4 ) = _____________ 2( x - 3a + 2c ) = _____________

- ( x + 2y ) = - 1 • ( x + 2y )= ________________

Terms, coefficients, variable terms, variable expressions, combining similar terms,
How many terms? what are they ? 3x³ + 3x - 4 ➔ ________________

How many are constant terms ?

Same Questions for the polynomial - 2x² + 2y - 5 ➔ ________________
What are the coefficient terms of $x^2 + x + 1$ ➔ 

of $-2x^2 - x + 3$ ➔ 

**Similar Terms (Like Terms):**

Combine terms. (Alternate form of the distributive law)

Instead of thinking of the distributive law in the form: $a(b + c) = ab + ac$,

let us think of it as $ab + ac = a(b + c)$

$8x + 13a = \underline{\phantom{0000}}$  $12c - 16c = \underline{\phantom{0000}}$  $6c - 6c = \underline{\phantom{0000}}$

$2x - 4y + 3x = \underline{\phantom{0000}}$  $3x + y + 4x - 4y = \underline{\phantom{0000}}$

$2x + 3(x + 4) = \underline{\phantom{0000}}$  $4 + 2(3x - 1) = \underline{\phantom{0000}}$

$2c - 2[2 - 3(2c - 3)] = \underline{\phantom{0000}}$
Polynomials:

**Def. A monomial** is a number, a variable, or a product of numbers and variables. Exponents on variables must be nonnegative integers.

**Def. A polynomial** is a variable expression in which the terms are monomials (a sum of monomials).

A polynomial with one term is called a _____________

with two terms $\rightarrow$ _____________

with three terms $\rightarrow$ _____________

**Addition of polynomials.** Combine similar terms (like terms)

ex. $(3x^2 + 2x - 3) + (5x^2 - 4x - 12) = $ _________________

ex. $(2xy + x) + (5xy + y) = $ _________________

**Subtraction:** We perform subtraction operations as before - write as an addition problem and use addition rules.

ex. $(2x - 3xy) - (4x - 2y) = $ _________________

ex. $(2x + y - 3) - (3x - 2y - 4) = $ _________________
Degree of a monomial:

\[ x^3 \rightarrow \underline{\text{__________}} \quad x^{10} \rightarrow \underline{\text{__________}} \quad 5x^6 \rightarrow \underline{\text{__________}} \]

\[ 2x^3y \rightarrow \underline{\text{__________}} \quad 12x^2y^8 \rightarrow \underline{\text{__________}} \]

Degree of a polynomial:

\[ 1 + x + x^{10} \rightarrow \underline{\text{__________}} \quad 2 + 3y - 4x^{20} \rightarrow \underline{\text{__________}} \]

\[ 2xy + 3 \rightarrow \underline{\text{__________}} \quad 2^5 + x + x^3 \rightarrow \underline{\text{__________}} \]

\[ 4x^2y^2 + 3y^4 \rightarrow \underline{\text{__________}} \]

Multiplication of Polynomials:

Rules of exponents:

1. If \( m \) and \( n \) are positive integers (natural numbers), then

\[ x^m \cdot x^n = x^{m+n} \]

ex. Find \( a^4 \cdot a^8 = \underline{\text{__________}} \quad 4^3 \cdot 4^{10} = \underline{\text{__________}} \quad (-2)^4 (-2)^3 = \underline{\text{__________}} \]

What about \( x^3 \cdot y^5 = \underline{\text{__________}} \) or \( (4x^3) (3x^2) = \underline{\text{__________}} \)

\( (2a^3 b) (a^3b^5) = \underline{\text{__________}} \)

2. If \( m \) and \( n \) are positive integers, then \( (x^m)^n = \underline{\text{__________}} \)

ex. Find \( (2^3)^4 = \underline{\text{__________}} \quad (x^3)^2 = \underline{\text{__________}} \)

3. If \( m \), \( n \), and \( p \) are positive integers, then

\( (x^m y^n)^p = \underline{\text{__________}} \)

ex \( (2x^3)^4 = \underline{\text{__________}} \quad (x^4 y^2)^5 = \underline{\text{__________}} \)
These types of rules help us multiply monomials together but what about the product of polynomials?

Products of powers of 10.

What is \( 123.45 \cdot 100 \)? = \_

Find \( 3.01 \cdot 1000 \) = \_

Quotients of powers of 10.

What is \( 123.45 \div 10^2 \)? = \_

Find \( 0.056 \div 0.01 \) = \_

Convert to a decimal –

\( \frac{9}{16} \) = 

\( \frac{7}{4} \) = 

\( \frac{5}{3} \) = 

\( 3 \frac{2}{9} \) = 

Exponents – Just like we worked with natural numbers, whole numbers, integers, we can work with fractions.

ex. \( \left( \frac{2}{3} \right)^2 \) = 

ex. \( \left( \frac{2}{5} \right)^2 \) = 

ex. \( \left( 2 \frac{1}{2} \right)^3 \cdot \left( 1 \frac{1}{2} \right)^3 \) = 

65
0.1 Homework – 20, 15, 10, 0
0.2 { 0, 1, 2, 3, … } is called the set of ________________
0.3 The set of rational numbers consists of ___________ and proper fractions or mixed numbers.
   Each of these numbers can be written as a fraction and have a terminating decimal expression or
   have a repeating part if it is nonterminating
1. Write as a fraction 0.019
2. Write as a fraction in simplest (reduced) form; 0.02
3. Write in decimal form
   a) 3/1000 = __________
   b) 3/8 = __________
4. Write in words; 103.016
5. Round to the nearest thousandth 31.00167
6. Perform the given operation (add, subtract, multiply, divide)
   a) 3.1 + (-1.01) = __________
   b) 2.01 • 1.1 = __________
   c) 1.02 - 4.1 = __________
   d) 3.08 ÷ 0.4 = __________
7. Evaluate. $x^2 - y$ if $x = -1.1$ and $y = 0.1$
8. Find the solution of each of the following equations.
   
a) \(0.2 \times x = 9.8\)  
b) \(4.2 - 2x = 6.8\)

More HW problems on page 267-272

Square roots, radicals \(\sqrt{\phantom{x}}\), Product Property of Square roots

Name__________________________ Math 130A – Quiz #12, October 5, 2001

0.1 Homework  20, 15, 10, 0  ➜  ____________

1. Give me an example of an improper fraction. ____________

2. Write \(\frac{6}{5}\) in decimal form. ____________

3. Solve for x. \(0.5 - 0.2 \times x = 1.03\)

4. \(2 \times 0.4 = \phantom{0}_______\)

5. \(4 + 3.05 = \phantom{0}_______\)

6. \(10.1 - 8.01 = \phantom{0}_______\)

7. A pen sells for $1.50 after taxes. You pay with $20 and get $6.50 back in change – how many pens did you buy if all your money went towards the purchase of pens.

8. 6 % of the students in Math 130A are known to drop out of school at the end of the semester. If there are 240 students enrolled during the semester, then how many will return next semester?
   
   (HINT: use the fact that 6 % = 0.06 )
1. What do you call the set of real numbers that can be written as fraction (have terminating decimal expressions or repeat)?

2. Find the square roots of 36. __________

3. Simplify the following radicals.
   a) $\sqrt{49} = __________$  
   b) $\sqrt{100} = __________$  
   c) $\sqrt{1600} = __________$

   d) $\sqrt{16} \cdot \sqrt{25} = __________$  
   e) $4 \sqrt{36} = __________$

4. Complete the formula $\sqrt{a \cdot b} = __________$

5. Write the following in simplest form by using the formula in #4.
   a) $\sqrt{8} = __________$  
   b) $\sqrt{32} = __________$

6. Use a number line to plot $x > 4$  

68
7. Use a number line to plot \( x \leq -2 \)

8. List two consecutive integers that \( \sqrt{32} \) lies between? \( \underline{} < \sqrt{32} < \underline{} \)

Math 130A – Week 7, day 2, October 10, 2001 - Quiz

1. Simplify
   
   a) \( 4 (3x) = \underline{} \)  
   b) \(-2(3x) = \underline{} \)

   c) \(-\frac{5}{3}(2a) = \underline{} \)  
   d) \((4x)(5x) = \underline{} \)

   e) \(-4(-\frac{1}{4}a) = \underline{} \)  
   f) \(-4h + 3h = \underline{} \)

   g) \(2(h + 5) = \underline{} \)  
   h) \(4 + (-2) - 2y = \underline{} \)

2. List the terms of

3. What are the coefficients of

4. Simplify by combining like (similar) terms
